

Water and Wastewater Operators

Treating wastewater for safe release back into the environment and providing clean drinking water is crucial to maintaining a safe and healthy living environment. As communities find it more and more difficult to stay in compliance with regulatory requirements, you can be confident that ISG's multi-disciplinary team of experts can help guide your design and operational decisions.

ISG provides proven, creative solutions for our client's environmental management and operational needs. Our extensive analysis and evaluation of existing conditions is the prime factor in determining our successful planning to solve our client's problems. Our expert staff is experienced with environmental engineering which assures that we will correct problems. At the same time, we will simplify operations, increase ease of maintenance and improve overall operational efficiency.

In addition to system design, we also offer Water and Wastewater Operator Services. For a reasonable monthly fee, we will manage the community system under our "affidavit operator" service program. Certified operators manage the community system by monitoring its water and wastewater facilities so the community will stay compliant with state and local regulations.

If you have staff available to perform these services, but lack training, we also offer customized training services.
